

# AcquaTempus

arelia

## THE PLUS FUNCTION

**To activate this function and be able to limit the maximum number of showers per 24-hour period, you must follow these two steps:**

**1**

In order to activate the internal Acqua Tempus timer, press SET + INFO, at which point the clock starts its 24-hour count down.

**2**

To set the PLUS function, press the INFO button for more than 3 seconds, which will put you in programming mode. You must now set the parameters for Shower Time, Soaping, and Waiting, programming them according to your needs. After setting each parameter, you must press the INFO button in order to go to the next setting. Once these three parameters have been set, using the INFO button you must pass through the menus until you reach the seventh menu, in which the three logos for Shower time, Soaping Time and Waiting light up. This is where you must set the maximum number of showers per 24 hours using the + or - keys.

Subsequently, just let Acqua Tempus exit programming mode and the maximum number of showers every 24 hours will have been established.

**After setting this limit, if someone wants to exceed the maximum number of showers programmed, Acqua Tempus will not allow for this. If you press the INFO button, you will see three horizontal lines (- - -) indicating that there will be no more showers until the next day.**

**In case the shower is blocked, please click on**

**to reactivate it**
